

Data Snapshot

Methods: Clients were assessed for their risk of malnutrition at the start of MANNA's medically tailored meal program (intake) and during the recertification process (follow-up) to measure change in nutritional status:

Results: There was a 34% reduction in the proportion of clients who screened at-risk for malnutrition at intake vs. follow-up across all disease states*

Reductions by
DISEASE STATE:

*McNemar Test (p<.001) **McNemar Test (p<.05) *** not a significant difference
